

Impregnation Tank

With this innovative equipment it's possible to carry out pre-impregnation and multi-coating during the manufacturing process of bituminous waterproofing membrane

With this equipment it's possible to manufacture:

- multi-compound bituminous waterproofing membrane
- self-adhesive bituminous waterproofing membrane
- bituminous/asphalt roof underlayment
- Equipment main data
- Mechanical speed: up to 120 m/1'
- Compact: 3.5 – 5m long

Main features

- Perfect control of thickness on the top and on the bottom surface
- Variation of line speed does not affect the thickness of the membrane as this is guaranteed by the calendaring system
- There isn't any risk of cross contamination of the compounds
- The impregnation tank and coating tank are completely enclosed and this special protection thus guarantees additional safety for the operator
